## Poster code 2,1016

The unique automated sample preparation system, GO-HT series, have been on the European market since 2015. The system is authorized as a validated method by some European accreditation laboratories. In the same way, the EU commission has adopted legislation to reduce or halt the sale and use of certain brominated flame retardants (BFRs) in order to protect human health and the environment. The EFSA recommended the monitoring of BFRs in foodstuffs based on commission recommendation 2014/118. Therefore, the demand for viable technologies for the simultaneous analysis of PCDDs/PCDFs, PCBs, and PBDEs in foodstuffs has increased in European laboratories. We previously reported a procedure for the simultaneous analysis for PCDDs/PCDFs, PCBs, and PBDEs using the system. The method is much more effective than manual purification steps, which involve complicated operations. In this presentation, we report the simultaneous analysis of PCDDs / PCDFs / PCBs / PBDEs in feed and food samples as an application of the developed system. Based on the results of the quality control samples, real samples (unknowns), procedure blanks, and standard reference materials (SRMs), the fractionations of PCDDs / PCDFs / PCBs / PBDEs, limit of quantification (LOQ), accuracy, and recoveries are discussed.

## CONCLUSIONS

The ways of efficient elution of PBDEs from Si-column: following two methods,

1. Adding small amount of Ethyl acetate to the sample solution, However, it depends on the sample species and sample volume / weight. So, this way is helpful for the laboratories that usually implement the inspection of the common foodstuff products.
2. Increasing elution volume, $140 \sim 160 \mathrm{~mL}$ of n -hexane at 60 dC . It is not affected by the sample species, etc. So, this method is effective for the laboratories that usually treat the many sample species.
The background level of column and system of 209-decaBDE is extremely near zero.
The recoveries and trueness of PCDDs/PCDFs and PCBs were obtained good results to all the samples. Trueness of PBDEs obtained by use of CRM is within $\pm 20 \%$.

## SAMPLE PREPARATION

| Mobile Phase | Additive | Polarity | Boiling point dC | Structure |
| :---: | :---: | :---: | :---: | :---: |
| n -Hexane | --- | 1.88 | 69 | $\cdots$ |
| n -Heptane | --- | 1.92 | 98 | $\cdots$ |
| Cyclohexane | --- | 2.02 | 80 | $\square$ |
| n -Hexane | Toluene | 2.38 | 110 | 为 |
|  | Ethyl acetate | 6.02 | 76 | $\stackrel{\mathrm{O}_{3} \stackrel{\circ}{\mu}_{\mathrm{O}}^{\mathrm{O}} \mathrm{CH}_{3}}{ }$ |
|  | THF | 7.58 | 65 | $\square$ |
|  | DCM | 8.93 | 40 |  |
|  | 2-propanol | 20.33 | 98 |  |
|  | Acetone | 20.70 | 56 | $\underset{\mathrm{H}_{3} \mathrm{C}}{\stackrel{\circ}{\stackrel{\circ}{\mathrm{CH}_{\mathrm{CH}}^{3}}} \mathrm{C}_{2}}$ |

The normal method requires 90 mL of n -Hexane as mobile phase for elution of PCDDs/PCDFs and PCBs from Si-column. However, It is difficult to elute PBDEs from Si-column with only $n$-hexane, because PBDEs are strongly adsorbed on the silica gel because of higher polarities and stronger interaction that occurs between a halogen (bromine) atom (Lewis acid) and a Lewis base (silica gel). (Halogen bond: $\mathrm{F}<\mathrm{Cl}<\mathrm{Br}<\mathrm{I}$ )

The recoveries of \#209-BDE of all the samples are lower. This indicates that it is difficult to elute \#209-BDE from Si-column with only 90 mL of n -hexane. Notably, the recoveries of the following samples are not very good, less than 1 to 2 g of Mineral oil, raw milk fat, butter, some feeds, fish liver oil, fish oil, poultry liver fat, and bovine (beef meat) fat.

Native PBDEs

|  | Milk fat 2.5g |  |  | Butter 2.5g |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hexane | 140mL | 90 mL | 90 mL | 140 mL | 90 mL | 90 mL |
| Ethyl Acetate | --- | 0.2 mL | 0.4 mL | --- | 0.2 mL | 0.4 mL |
| \#3-MoBDE | 0\% | 0\% | 0\% | 0\% | 0\% | 0\% |
| \#7-Dibde | 0\% | 0\% | 0\% | 0\% | 0\% | 0\% |

| \#99-PeBDE | 111\% | 113\% | 85\% | 104\% | 98\% | 100\% |
| \#85-PeBDE | 105\% | 119\% | 81\% | 110\% | 86\% | 92\% |
| \#126-PeBDE | 101\% | 94\% | 68\% | 105\% | 72\% | 65\% |
| \#154-HxBDE | 117\% | 105\% | 81\% | 104\% | 97\% | 107\% |
| \#153-HxBDE | 118\% | 105\% | 83\% | 109\% | 100\% | 98\% |
| \#138-HxBDE | 115\% | 99\% | 86\% | 118\% | 88\% | 101\% |
| \#156-HxBDE | 124\% | 82\% | 69\% | 100\% | 69\% | 79\% |
| \#184-HpBDE | 90\% | 114\% | 72\% | 83\% | 73\% | 79\% |
| \#183-HpBDE | 106\% | 120\% | 79\% | 88\% | 104\% | 115\% |
| \#191-HpBDE | 94\% | 119\% | 118\% | 120\% | 118\% | 116\% |
| \#197-OcBDE | 107\% | 95\% | 74\% | 91\% | 83\% | 91\% |
| \#196-OcBDE | 103\% | 85\% | 72\% | 77\% | 82\% | 94\% |
| \#207-NoBDE | 108\% | 106\% | 72\% | 99\% | 82\% | 98\% |
| \#206-NoBDE | 115\% | 119\% | 84\% | 102\% | 75\% | 116\% |
| \#209-DeBDE | 107\% | 118\% | 61\% | 90\% | 82\% | 85\% |

The recoveries of \#209-BDE obtained by improved two methods seem to be better than normal method. However, The way of addition of ethyl acetate should be valided one step further to each sample.

## CHROMATOGRAMS OF PROCEDURE BLANK

(BD-5HT, 15m, 1 injection measurement)

## VALIDATION: RESULTS OF SRM

Cod liver oil 1 g (CIL, EDF-5463 )
